Project Development Phase Sprint 1

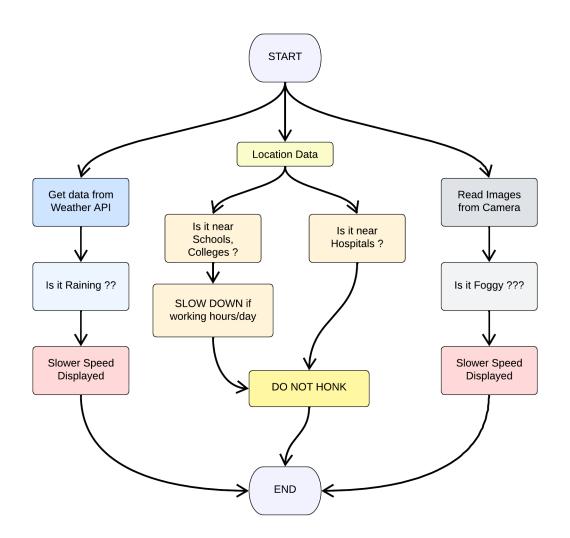

Date	24 October 2022
Team ID	PNT2022TMID41539
Project Name	Project-Signs with Smart Connectivity for Better Road Safety

Sprint 1:

Sprint Goals:

- 1. Create and initialize accounts in various public APIs like OpenWeather API.
- 2. Write a Python program that outputs results given the inputs like weather and location.

Code Flow:

Program Code:

Weather.py

This is a utility function that fetches the weather from OpenWeatherAPI. It returns only certain required parameters of the API response.

```
# Python code
import requests as reqs
def get(myLocation,APIKEY):
  apiURL =
f"https://api.openweathermap.org/data/2.5/weather?q={myLocation}&appid={APIKEY}"
  responseJSON = (reqs.get(apiURL)).json()
  returnObject = {
    "temperature": responseJSON['main']['temp'] - 273.15,
    "weather": [responseJSON['weather'][_]['main'].lower() for _ in
range(len(responseJSON['weather']))],
    "visibility": responseJSON['visibility']/100, # visibility in percentage where 10km is
100% and 0km is 0%
 }
 if("rain" in responseJSON):
    returnObject["rain"] = [responseJSON["rain"][key] for key in responseJSON["rain"]]
 return(returnObject)
```

Brain.py

This file is a utility function that returns only essential information to be displayed at the hardware side and abstracts all the unnecessary details. This is where the code flow logic is implemented.

```
if(localityInfo["hospitalsNearby"]):
    # hospital zone
    doNotHonk = True
 else:
    if(localityInfo["schools"]["schoolZone"]==False):
      # neither school nor hospital zone
      doNotHonk = False
    else:
      # school zone
      now = [dt.now().hour,dt.now().minute]
      activeTime = [list(map(int,_.split(":"))) for _ in localityInfo["schools"]["activeTime"]]
      doNotHonk = activeTime[0][0]<=now[0]<=activeTime[1][0] and
activeTime[0][1]<=now[1]<=activeTime[1][1]</pre>
 return({
    "speed": finalSpeed,
    "doNotHonk" : doNotHonk
 })
# UTILITY LOGIC SECTION ENDS
```

Main.py

The code that runs in a forever loop in the micro-controller. This calls all the util functions from other python files and based on the return value transduces changes in the output hardware display.

```
# Python code
# IMPORT SECTION STARTS
import brain
# IMPORT SECTION ENDS
# -----
# USER INPUT SECTION STARTS
myLocation = "Chennai,IN"
APIKEY = "bf4a8d480ee05c00952bf65b78ae826b"
localityInfo = {
 "schools" : {
    "schoolZone": True,
    "activeTime" : ["7:00","17:30"] # schools active from 7 AM till 5:30 PM
   },
 "hospitalsNearby": False,
 "usualSpeedLimit": 40 # in km/hr
}
```

USER INPUT SECTION ENDS # -----

MICRO-CONTROLLER CODE STARTS

print(brain.processConditions(myLocation,APIKEY,localityInfo))

ш

MICRO CONTROLLER CODE WILL BE ADDED IN SPRINT 2 AS PER OUR PLANNED SPRINT SCHEDULE

m

MICRO-CONTROLLER CODE ENDS

Output:

Code Output

{'speed': 40, 'doNotHonk': False}

Image:
